Little Rock, AR. 72212

Dear Mr. Robinson:

It has been 55 years since research and development began to find a cure for Multiple Sclerosis and as of today, none have been found. In 1986 I was diagnosed as having the spastic type of M.S.. My left arm and hand, along with both my legs, gradually became paralyzed. I went from being a nurse to being a patient and it has been emotional, to say the least.

Last July, Michael Landgraf brought up the subject of InnerQuest technology. Because of M.S. and the medications I take, there was a strong possibility of seizures occurring. After consulting my physician, I received medical clearance and began using my I.Q. Tutor in August. I use my unit often and have yet to experience any seizure activity. I have experienced less muscle cramping, my spasms have decreased, the fingers of my left hand now move on command after over two years of paralysis and I have an overall feeling of well-being, which has been lacking for years. Like my doctor, my nurse and my physical therapist, I am very excited and totally amazed.

InnerQuest technology has given me added strength in my endeavor to overcome this dreadful disease. My goal is to one day walk again and when that day comes, I intend to visit Little Rock and personally shake your hand. Thank you very much for making my life more tolerable and more relaxing.

Sincerely,

Darby Hewitt
